

- If we use an *improper* prior, then we do not specify a joint model for our data and parameters

What is the problem with ‘vaguer’ priors?

- More importantly, we do not specify a data generating mechanism $p(y)$

- By construction, these priors do not regularize inferences, which is quite often a bad idea

- Proper but diffuse is better than improper but is still often problematic

What is the problem with “vague” priors?
